WHAT IS CLAIMED IS:

- 1. A display device comprising:
- a display medium layer; and
- a first electrode and a second electrode, which face each other with the display medium layer interposed between them,

wherein the first electrode includes: a first conductive layer; and a first polymer film, which covers the first conductive layer and which makes contact with the display medium layer,

wherein the second electrode includes: a second conductive layer; and a second polymer film, which covers the second conductive layer and which makes contact with the display medium layer, and

wherein at least a portion of the first conductive layer has a different work function from the second conductive layer, and

wherein the number of benzene rings included in each of the first and second polymer films is 0.4 or less for a molecular weight of 100.

2. The device of claim 1, wherein the first and second polymer films exhibit a transmittance of about 97% or more with respect to incoming light having a wavelength of about 400 nm to about 500 nm.

- 3. The device of claim 1, wherein the first conductive layer is a reflective conductive layer and the second conductive layer is a transparent conductive layer.
- 4. The device of claim 3, further comprising another transparent conductive layer, which is provided as a third conductive layer in the first electrode.
- 5. The device of claim 1, wherein the display medium layer includes a liquid crystal material, and

wherein the first and second polymer films are alignment films.

- 6. The device of claim 1, wherein a voltage being applied to the display medium layer for display purposes is updated at a frequency of about 45 Hz or less.
- 7. The device of claim 3, wherein the transparent conductive layer includes ITO, and the reflective conductive layer includes Al.
- 8. The device of claim 1, wherein an AC voltage, which includes an additional offset voltage and which changes its polarity at regular intervals, is applied to the display medium layer.

- 9. The device of claim 1, wherein a variation in potential difference between potential levels of the first and second electrodes right after the device has been exposed to light is about 10% or less of a voltage that is applied to display a grey-scale tone.
- 10. A mobile electronic appliance comprising the display device of claim 1.
 - 11. A display device comprising:
 - a display medium layer; and
- a first electrode and a second electrode, which face each other with the display medium layer interposed between them,

wherein the first electrode includes: a first conductive layer; and a first polymer film, which covers the first conductive layer and which makes contact with the display medium layer,

wherein the second electrode includes: a second conductive layer; and a second polymer film, which covers the second conductive layer and which makes contact with the display medium layer, and

wherein at least a portion of the first conductive layer has a different work function from the second conductive layer, and

wherein a variation in potential difference between potential levels of the first and second electrodes right after the device has been exposed to light is about 10% or less of a voltage that is applied to display a grey-scale tone.

12. The device of claim 11, wherein the display medium layer includes a liquid crystal material, and

wherein the variation in potential difference has an absolute value of at most about 250 mV.

- 13. The device of claim 12, wherein the variation in potential difference has an absolute value of at most about 30 $\,$ mV.
- 14. The device of claim 11, wherein the number of benzene rings included in each of the first and second polymer films is 0.4 or less for a molecular weight of 100.
- 15. The device of claim 11, wherein the first and second polymer films exhibit a transmittance of about 97% or more with respect to incoming light having a wavelength of about 400 nm to about 500 nm.
 - 16. The device of claim 11, wherein the first conductive

layer is a reflective conductive layer and the second conductive layer is a transparent conductive layer.

- 17. The device of claim 16, further comprising another transparent conductive layer, which is provided as a third conductive layer in the first electrode.
- 18. The device of claim 11, wherein the first and second polymer films are alignment films.
- 19. The device of claim 11, wherein a voltage being applied to the display medium layer for display purposes is updated at a frequency of about 45 Hz or less.
- 20. The device of claim 16, wherein the transparent conductive layer includes ITO, and the reflective conductive layer includes Al.
- 21. The device of claim 11, wherein an AC voltage, which includes an additional offset voltage and which changes its polarity at regular intervals, is applied to the display medium layer.
- 22. A mobile electronic appliance comprising the display device of claim 11.
